

## Copying an angle

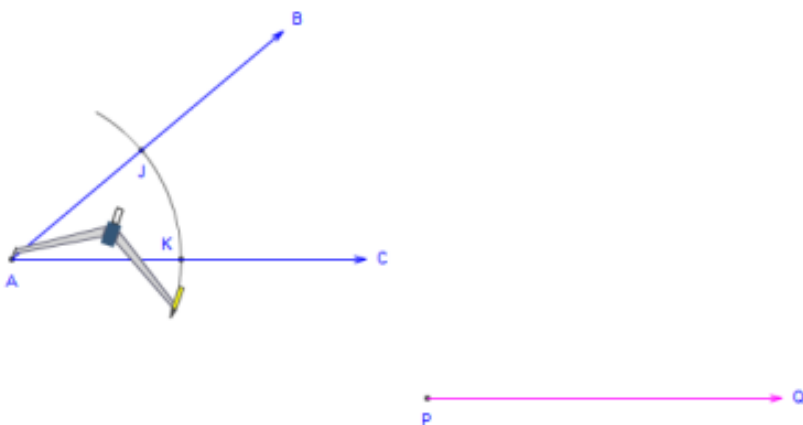

After doing this	Your work should look like this
Start with a angle BAC that we will copy.	 A diagram showing an angle with vertex A. One ray extends horizontally to the right, passing through point C. The other ray extends upwards and to the right, passing through point B.
1. Make a point P that will be the vertex of the new angle.	 The diagram shows the original angle BAC with vertex A. Below it, a new point P is marked with a small dot and labeled 'P'.
2. From P, draw a ray PQ. This will become one side of the new angle. <ul style="list-style-type: none"><li>• This ray can go off in any direction.</li><li>• It does not have to be parallel to anything else.</li><li>• It does not have to be the same length as AC or AB.</li></ul>	 The diagram shows the original angle BAC with vertex A. Below it, a new ray is drawn starting from point P and extending horizontally to the right, passing through point Q. The ray is colored pink.

**After doing this****Your work should look like this**

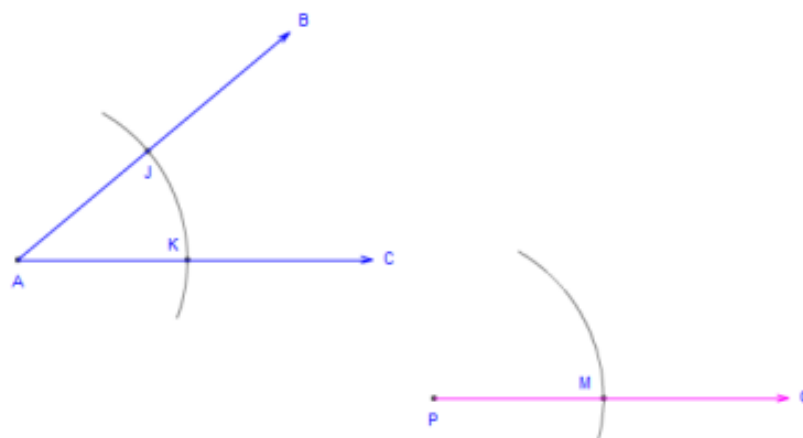

**3.** Place the compasses on point A, set to any convenient width.

**4.** Draw an arc across both sides of the angle, creating the points J and K as shown.

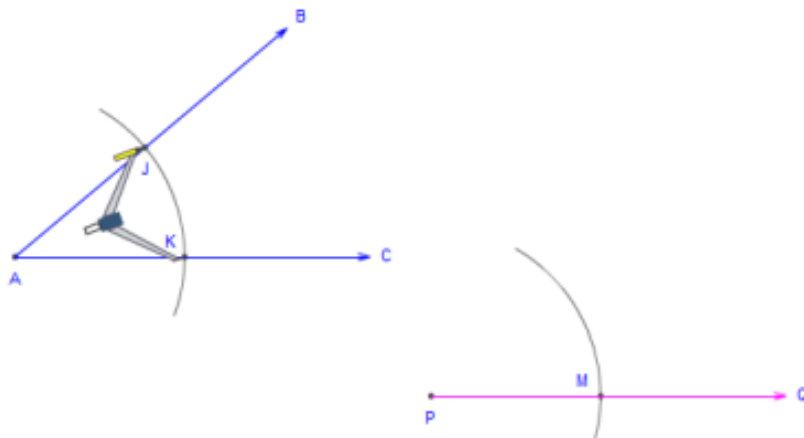

**5.** Without changing the compasses' width, place the compasses' point on P and draw a similar arc there, creating point M as shown.

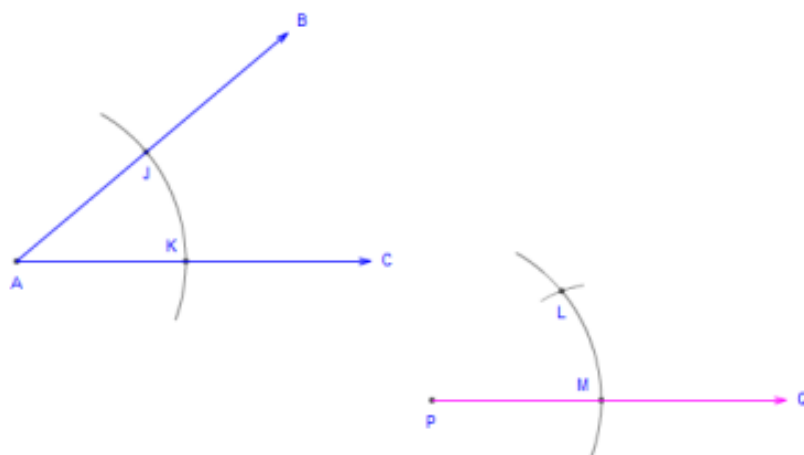

**After doing this****Your work should look like this**

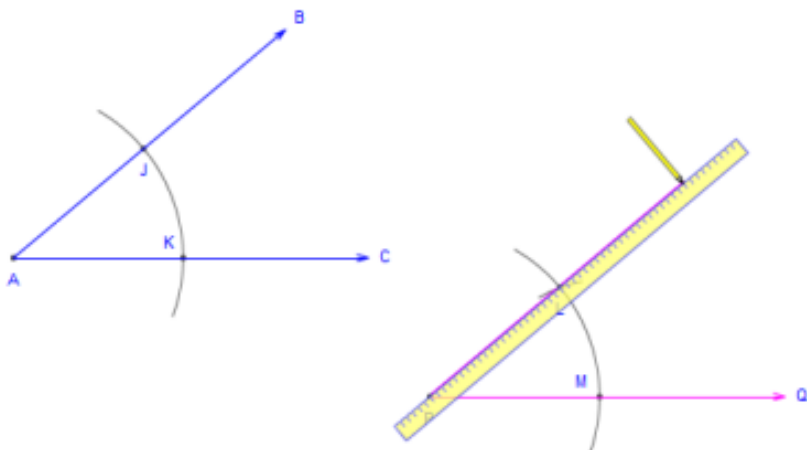

6. Set the compasses on K and adjust its width to point J.

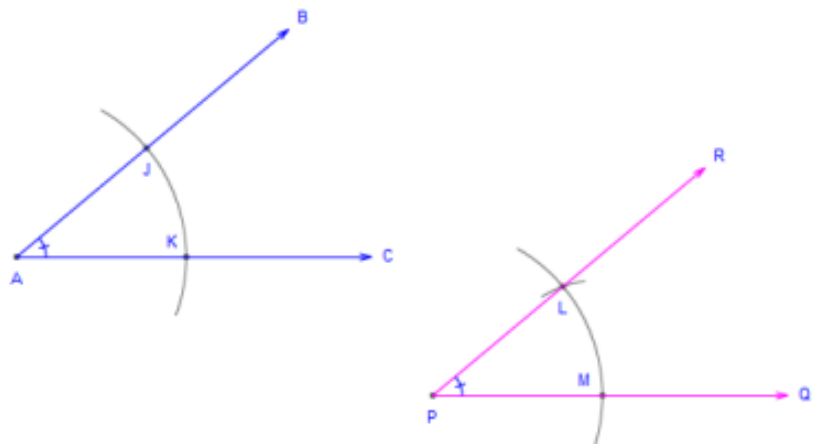

7. Without changing the compasses' width, move the compasses to M and draw an arc across the first one, creating point L where they cross.

8. Draw a ray PR from P through L and onwards a little further. The exact length is not important.

After doing this	Your work should look like this
<p><b>Done.</b> The angle <math>\angle RPQ</math> is <b>congruent</b> (equal in measure) to angle <math>\angle BAC</math>.</p>

## Other constructions pages on this site

[List of printable constructions worksheets](#)

### Lines

[Introduction to constructions](#)

[Copy a line segment](#)

[Sum of n line segments](#)

[Difference of two line segments](#)

[Perpendicular bisector of a line segment](#)

[Perpendicular at a point on a line](#)

Perpendicular from a line through a point

Perpendicular from endpoint of a ray

Divide a segment into  $n$  equal parts

Parallel line through a point (angle copy)

Parallel line through a point (rhombus)

Parallel line through a point (translation)

## Angles

Bisecting an angle

Copy an angle

Construct a  $30^\circ$  angle

Construct a  $45^\circ$  angle

Construct a  $60^\circ$  angle

Construct a  $90^\circ$  angle (right angle)

Sum of  $n$  angles

Difference of two angles

Supplementary angle

Complementary angle

Constructing  $75^\circ$   $105^\circ$   $120^\circ$   $135^\circ$   $150^\circ$  angles and more

## Triangles

Copy a triangle

Isosceles triangle, given base and side

Isosceles triangle, given base and altitude

Isosceles triangle, given leg and apex angle

Equilateral triangle

30-60-90 triangle, given the hypotenuse

Triangle, given 3 sides (sss)

Triangle, given one side and adjacent angles (asa)

Triangle, given two angles and non-included side (aas)

Triangle, given two sides and included angle (sas)

Triangle medians

Triangle midsegment

Triangle altitude

Triangle altitude (outside case)

## **Right triangles**

Right Triangle, given one leg and hypotenuse (HL)

Right Triangle, given both legs (LL)

Right Triangle, given hypotenuse and one angle (HA)

Right Triangle, given one leg and one angle (LA)

## **Triangle Centers**

Triangle incenter

Triangle circumcenter

Triangle orthocenter

Triangle centroid

## **Circles, Arcs and Ellipses**

Finding the center of a circle

Circle given 3 points

Tangent at a point on the circle

Tangents through an external point

Tangents to two circles (external)

Tangents to two circles (internal)

Incircle of a triangle

Focus points of a given ellipse

Circumcircle of a triangle

## **Polygons**

Square given one side

Square inscribed in a circle

Hexagon given one side

Hexagon inscribed in a given circle

Pentagon inscribed in a given circle

### **Non-Euclidean constructions**

Construct an ellipse with string and pins

Find the center of a circle with any right-angled object
