MCA lesson  
4.2 and 4....

# Graphs and Functions

## 4.2 Graphs of Equations in Two Variables

## 4.4 Slope and Graphs of Linear Equations

## What You Will Learn

- ▶ Sketch graphs of equations using the point-plotting method.
- ▶ Find and use  $x$ - and  $y$ -intercepts as aids to

- ▶ Find and use  $x$ - and  $y$ -intercepts as aids to sketching graphs.
- ▶ Test graphs for symmetry.
- ▶ Use the verbal problem-solving method to write an equation and sketch its graph.

## What You Will Learn

- ▶ Determine the slope of a line through two points.
- ▶ Write linear equations in slope-intercept form and graph the equations.
- ▶ Use slopes to determine whether lines are parallel, perpendicular, or neither.

# The Slope of a Line 1

The slope  $m$  of a non vertical line that passes through the points  $(x_1, y_1)$  and  $(x_2, y_2)$  is

$$\begin{aligned} m &= \frac{y_2 - y_1}{x_2 - x_1} \\ &= \frac{\text{Change in } y}{\text{Change in } x} \\ &= \frac{\text{Rise}}{\text{Run}} \end{aligned}$$

where  $x_1 \neq x_2$ .

## Example 1 – Sketching the Graph of an Equation

Sketch the graph of  $3x + y = 5$ .  $y = mx + b$

**Solution:** Begin by solving the equation for  $y$ , so that  $y$  is isolated on the left.

**Solution:** Begin by solving the equation for  $y$ , so that  $y$  is isolated on the left.

$$y = -3x + 5$$

$$y = mx + b$$

$\downarrow$  slope  $\rightarrow$  y-int

## Slope as a Graphing Aid 1

Sketch the graph:  $3x - 2y = 4$  Rewrite in slope-intercept form.

$$y = mx + b$$

$$-2y = -3x + 4$$

$$y = \frac{3}{2}x - 2$$

$$\begin{aligned}
 3(0) - 2y &= 4 \\
 0 - 2y &= 4 \\
 \frac{-2y}{-2} &= \frac{4}{-2} \\
 y &= -2 \\
 (0, -2) \\
 3(2) - 2y &= 4 \\
 6 - 2y &= 4 \\
 \frac{-2y}{-2} &= \frac{-2}{-2} \\
 y &= 1 \\
 (2, 1)
 \end{aligned}$$

# Parallel and Perpendicular Lines 1

You know from geometry that two lines in a plane are **parallel** if they do not intersect, and two lines in a plane are **perpendicular** if they intersect at right angles.

## Parallel Lines and Perpendicular Lines

**Parallel Lines:** Two distinct nonvertical lines are parallel if and only if they have the **same slope**.

**Perpendicular Lines:** Two lines are perpendicular if and only if their slopes are **negative reciprocals** of each other. That is,

$$-\frac{4}{5} \quad \frac{5}{4} \quad \frac{3}{1} \quad -\frac{1}{3} \quad m_1 = -\frac{1}{m_2}$$

$$y = 3x + 2$$

$$y = 3x - 4$$

## Example 2 – Graphing a Nonlinear Equation

Sketch the graph of  $x^2 + y = 4$ .

Sketch the graph of  $x^2 + y = 4$ .

**Solution:**

$$-3^2 + y = 4$$

Begin by solving the equation for y, so that y is isolated on the left.

$$\begin{array}{r} 4 + y = 4 \\ -4 \quad -4 \\ \hline y = -5 \end{array}$$

$$x^2 + y = 4$$

$$\begin{array}{r} x^2 + y = 4 \\ -2^2 + y = 4 \\ 4 + y = 4 \\ -4 \quad -4 \\ \hline y = 0 \end{array}$$

Next, create a table of values, as shown below.

X	-3	-2	-1	0	1	2	3
$y = -x^2 + 4$	-5	0	3	4	3	0	-5
<b>Solution point</b>	<b>(-3, -5)</b>	<b>(-2, 0)</b>	<b>(-1, 3)</b>	<b>(0, 4)</b>	<b>(1, 3)</b>	<b>(2, 0)</b>	<b>(3, -5)</b>

Pear Deck Interactive Slide  
Do not remove this bar

$$\begin{array}{r} 1^2 + y = 4 \\ -1 + y = 4 \\ -1 \quad -1 \\ \hline y = 3 \end{array}$$

$$\begin{array}{r} -1^2 + y = 4 \\ -1 + y = 4 \\ -1 \quad -1 \\ \hline y = 3 \end{array}$$

## Example 2 – Graphing a Nonlinear Equation cont'd

Now, plot the solution points. Finally, connect the points with a smooth curve. \*Also factor to prove

The x-intercepts. Draw your line of symmetry & plot.

$$\begin{array}{r} x^2 + y = 4 \\ -x^2 \\ \hline y = -x^2 + 4 \end{array}$$

### Example 3 – Graphing an Absolute Value Equation

Sketch the graph of  $y = |x - 1|$ .

**Solution:**

$$y = |-2 - 1| = 3$$

$$y = |-1 - 1| = 2$$

$$y = |0 - 1| = 1$$

$$y = |1 - 1| = 0$$

$$y = |2 - 1| = 1$$

$$y = |3 - 1| = 2$$

$$y = |4 - 1| = 3$$

X	-2	-1	0	1	2	3	4
$y =  x - 1 $	3	2	1	0	1	2	3
<b>Solution point</b>	$(-2, 3)$	$(-1, 2)$	$(0, 1)$	$(1, 0)$	$(2, 1)$	$(3, 2)$	$(4, 3)$

$$|0 - 1| = 1$$

$$|+1 - 1| = 0$$

$$|4 - 1| = 3$$

$$|3 - 1| = 2$$

### Example 3 – Graphing an Absolute Value Equation cont'd

Now, plot the solution points. It appears that the points lie in a “V-shaped” pattern, with the point  $(1,0)$  lying at the bottom of the “V.” Following this pattern, connect the points to form the graph.

$$y = |x - 1|$$

## Intercepts: Aids to Sketching Graphs

The point  $(a, 0)$  is called an **x-intercept** of the graph of an equation when it is a solution point of the equation. To find the x-intercept(s), let  $y = 0$  and solve the equation for  $x$ .

The point  $(0, b)$  is called a **y-intercept** of the graph of an equation when it is a solution point of the equation. To find the y-intercept(s), let  $x = 0$  and solve the equation for  $y$ .

## Example 4 – Identifying the Intercepts of Graphs

$$y = 4$$

$x = 2$

$y = -2(0) + 4$

$y = 4$

$y = 3$

## Example 4 – Identifying the Intercepts of Graphs cont'd

$x - 2 = 0$

$x = 2$

$x + 2 = 0$

$x = -2$

$y_{int} = 1$

Copyright © 2019 Cengage Learning. All rights reserved.

## Example 5 – Finding the Intercepts of a Graph 1

Find the intercepts and sketch the graph of  $y = 2x - 5$ .

**Solution:**

To find any x-intercepts, let  $y = 0$  and solve the resulting equation for  $x$ .

$$\begin{array}{ll}
 y = 2x - 5 & \text{Write original equation.} \\
 0 = 2x - 5 & \\
 -2x & \\
 -2x = -5 & \\
 \underline{-2x} & \underline{-5} \\
 x = 2.5 & 
 \end{array}$$

To find any y-intercepts, let  $x = 0$  and solve the resulting equation for  $y$ .

$$\begin{array}{ll}
 y = 2x - 5 & \text{Write original equation.} \\
 y = 2(0) - 5 & \\
 y = -5 & 
 \end{array}$$

## Example 5 – Finding the Intercepts of a Graph 2

So, the graph has one x-intercept, which occurs at the point  $(\frac{5}{2}, 0)$ , and one y-intercept, which occurs at the point  $(0, -5)$ .

Also use your y-intercept & slope to graph.

$$y = 2x - 5$$
$$y = \frac{2}{1}x - 5$$
$$y = mx + b$$
